

Powers Protocol

Governance for the programmable economy

DeepDAO:

Money held inside DAO treasuries (billions)

Traditional DAO governance is inefficient, insecure, noisy, a *lot* of work, slow => a total pain.

What crypto startups need

[Visualisation here (see note)]

Powers Protocol allows startups to create bespoke on-chain governance flows:

- separate powers in org
- create checks and balances between roles
- encode nested relationships between orgs
 - RBAC for deliberation channels

(ever tried to do this in a DAO?)

Demo

1. Overview
2. Forum

Why use Powers?

No drama governance.

RBAC your org | no buying votes | reduced workload | signal
over noise | transparency | accessible

Offerings

	Tier 1 (Free)	Tier 2 (Paid credits)	Tier 3 (bespoke pricing)
Basic access to mandates	✓	✓	✓
/design-org claude skill	✓	✓	✓
Full access to mandates		✓	✓
Bespoke solutions			✓
Legal advice / compliance			✓

Wider field

We bring crypto trust to governance where social and institutional trust is lacking

Crypto startups

We bring normal governance to crypto where governance infrastructure is lacking

Privy

Zerodev

Alchemy

Tiers

1 - Basic mandates: design your own org in about 30 minutes.
For free.

2 - Tier 1 +

Full access to mandates catalogue. More advanced organisations via agent in about 30 minutes. Paywall using credits

3 - Full consultancy - fully bespoke solutions, legal advice is included in pricing -> several weeks.

Differentiator → why use us where there are alternatives:

1. No need to vote on every decision - assign roles - delegate power in the org - no drama
2. Trust and transparency - no drama
3. Script - filings - legal entity compliance - collaboration across jurisdictions
4. Legacy institutions who acquire on-chain assets
5. Forum interface - easy - voting and communication in one place

Innovations (technical explanation):

1. Translate power in an org to degrees of control
2. Make execution of a mandate conditional on the execution of another mandate
3. Roles - you can do this all based on roles

Because of these technical innovations, the following becomes possible:

Assign accounts to roles

Assign powers to roles

Create checks and balances between roles

Create rules to reform governance rules

Business structure:

1. Consultancy LTD: Offerings are bespoke consultancy. Money comes from clients who are wanting to design governance systems for their organisation. Money also comes from endowment, grants, vc.
2. Powers Protocol incorporated entity: A blockchain aligned legal entity for governing the development and maintenance of the Powers Protocol and its mandates. Community includes builders, founders, funders and organisations who have built on Powers Protocol.

Team Name

Powers Protocol: Governance for the programmable economy

Who Buys, Who Uses

Context matters, we can pivot:

We will start with: Startups

Legacy institutions

Any community that needs trust that is beyond personal and institutional trust

(AI guardrails governance, Cultural organisation, repressive contexts)

First Reachable Audience

the narrow slice you can get to now, not everyone

Crypto startups, who already have existing blockchain infrastructure and assets

Proof You Need First

A real org, with a treasury containing funds, is deployed on Arbitrum, and can manage the distribution of funds to members within the org.

3 Distribution Channels

1. Powers Protocol: Telegram group, Twitter, website
2. Networking through governance interested institutions, such as Metagov or DAWO Switzerland (diplomacy)
3. Simulation Sessions: Regular small group test sessions to onboard and incubate participant ideas into paying client, invite friends (tupperware party strategy).

Core Message, One Sentence

No drama governance: Role-based, transparent, decision making and deliberation – without having to touch crypto.

The Intro That Helps

a specific intro from AF, OCL, a sponsor, or a protocol

Focussed on crypto: A commissioned demo of Powers Protocol from metagov
Broader landscape: Receiving large funds from EU Horizon, policymaking think-tank

5 Named Targets

real prospects, partners, communities, or protocols, by name

Crypto: Startup accelerator, grantmaking body

Crypto: Small startups who are getting started, governance needs, cannot fulfill them

Legacy: Arts Council England - gradual implementation

The Ask This Weekend

the one specific ask, plus the CTA for users

1. Recognition that this is an alternative governance protocol
2. Long-term mentorship
3. Connections to startups - being in the frontlines to offer this tool

Publius Projects

Cryptographic trust for Governance systems

Who is This For

Communities that need governance but cannot (or do not want to) rely on informal personal trust or institutional trust to enforce governance rules.

What They Do Today

Either they use DAOs, or informal channels of trust (discord, telegram) or multisig wallets.

Alternatives and Gaps

DAOs: too centralised & inefficient see the DAO crisis report by gov/acc

Off-chain entities that mimic decentralisation (CICs, Commons, Foundation etc): Messy communication channels, informal bias on the decisions, filings are tedious.

The Wedge

In crypto: see debate around ENS (and Arbitrum's AAE's), and collapse of DAOs in name of "efficiency".

Multisig wallets: insecure (politically & technically) & centralised

Discord, telegram: few corporations in control of information channels

Why Now

Gas reduction, maturity L2s

Maturity AA infra + EIP 7702, allowing gas sponsorship: allows for people to participate in governance without touching wallets.

Collapse of traditional DAO "Governance": ENS, Aave - but also Tally, Aave.

Why Onchain, Why Arbitrum

Why on-chain: Cryptography + proof of stake, etc trust of blockchains transferred to governance systems.

Arbitrum: Fast, cheap, reliable, decentralised, good support & active community. Lots of potential crypto user cases natively on arbitrum

First 5-10 Users

1: **Cultural Stewardship:** Artists who want to build communities that go beyond existing, heavily gate kept landscape of institutionalised social / cultural orgs.

2: **Startups:** A founder at defi startups that want on-chain 'decentralised' but efficient and secure governance.

3: **On-the-ground movements:** An orgs that wants to build external support for activists in repressive regimes - giving local activist power without giving up their privacy.

4: **AI guardrails:** Orgs that want to organically integrate AI agents into decision-making while retaining guardrails.

5: **Institutions:** Legacy inst. that want to gradually integrate crypto assets & related gov.

Ship This Weekend

Deploy a demo organisation using /design-org to demonstrate how a bespoke governance system can be build and used by any of the user persona's described to the left.
